

Saleen PowerFlash

The quickest, most effective performance improvement for Mustangs is now available from Saleen. PowerFlash, the first and only automotive performance computer, provides immediate improvements in horsepower and torque for your Mustang. The PowerFlash does what no "chip" can do because it's not a chip. PowerFlash is a completely new program for your Mustang, which is loaded directly into your vehicle's PCM computer. It doesn't try to modify the stock code within the PCM computer; it replaces it with new performance programming.

Your car's PCM computer contains the logic to control the powertrain. Within this code, there exists over 4,000 variables. By utilizing the Ford Research Console, which is the implementation tool of the Vehicle Data Acquisitions System, Saleen calibrates the code for maximum performance at every aspect of engine operation. PowerFlash is custom calibrated to each vehicle application, and also eliminates the speed limiter. This new performance calibration delivers an additional 8 horsepower and 10 lbs.-feet of additional torque across the full power range. It additionally includes an option that modifies automatic transmission shift points for stronger upshifts and an option that will correct the speedometer for either a 3:55 or 3:73 gear ratio.

The base retail price of the Saleen PowerFlash is \$199.99, plus shipping and handling. The automatic transmission shift point option and speedo correction for different axle ratios option are \$50.00 each. The price includes special packaging and one-day turnaround by professionally trained Saleen technicians.

Responsiveness by the millisecond. The new Saleen PowerFlash performance calibration gives the Mustang more performance, more driveability and more reliability, with none of the driveability issues of chips.
